Thanks for the desire to educate or take huskies from NorSled, we should be taking things slower because of the Covid-19 virus, we only accept applications for parenting or adoption from previous/experienced husky owners. LITTLE 4-MONTH-OLD THEO NEEDS YOU! THEO NEEDS YOUR HELP!! Very important news about our cute four-month-old puppy from Erlimar, who was hit by a car and hit quite hard: Dr. Marina Manakhirova is very confident in all the necessary procedures. At the same time: 10/5/2020 - first, his right elbow is luxurious. She hopes to get away with a close/reduce/tire procedure. If all goes well, and if the elbow stays in place. It will tackle the most difficult segment of the shoulder (upper front leg) break, which is very active involved. Alas, this bad break started to heal, and although it's not a bad fracture it's shifted enough that plates and screws will be needed. Another break the back leg, but also required plates and screws. ugh three-fer 10/6/2020 - if all goes well, it should seam closed the upper lip where there is a gap and food can get stuck. She also neutered it. All this will be very expensive, the most NorSled will be spent on who the puppy, but it is worth it. This puppy has a lot going on for him - he was taken to Norsled and Sage by the vet as soon as we found out about him. NorSled has committed 110 per cent on his recovery and it's worth having a great life when it's done. We have a foster family for him with a great adopter who will shower him with love, care and attention. Theo is currently in foster care recovering from several surgeries and doing well. Please make a donation by clicking on the PayPal button found in the left column of this page. In addition, our Venmo information is listed there. Thank you! HOWL-O-WEEN VIRTUAL 5K RUN/WALK Anytime / Anywhere! Registration includes: T-shirt digital race Bib Finisher Medal Results Posted Online Free Shipping! (Packages start delivery on September 15!) To JOIN: Sign up for a run/Walk 5K Full 5K (3.1 miles) run or walk at any time or until October 31, watching proper social distancing, of course! Post your time online (we will send you instructions) Post your photos on our Facebook page (optional) Where is this race? It's a virtual 5k, so we ship your race pack to your front door and you finish the race when and where you choose! When is this race? You can complete the 5k distance at any time or until October 31! Should I run with my pet? No! We work to support pets, pet lovers, and animal charities! So you can run or walk with or without your pet! Click on the link below to register. Our Mission-Advocate for and/or Rescue stray, abandoned, displaced or mistreated dogs, especially the northern breed (Siberian huskies, Alaska malamutes, and related compounds) face euthanasia in Indiana shelters. Indiana. Put our rescue dogs in loving, safe, permanent homes with people who understand and celebrate the unique characteristics of their breeds. Not very impressed with that. As I see, readers of this book either already know how to do data science, or they will not. If they do (and here I ignore the fact that why would they, since the title of the book is the science of data from scratch), then they will find the explanations of the concepts too basic, and the Python code implementation examples are mostly useless (they, after all, I don't use libraries specifically designed for data science, and implementation isn't very impressed with this. and the implementation of a naive direct approach). And if they can't, they'll find explanations of concepts too meager to be useful, with examples of Implementation of Python code still useless, because a) they find it hard to follow without one understanding of concepts, and b) they're from scratch, so you can't even reuse them in production for concepts that you've understood. Overall, my biggest complaint is that the book covers not the science of data from scratch as advertised, but rather the implementation of the Python code from scratch, as it relates to the poorly explained concept of data science. The book is not completely useless, but certainly is not a good starting point for studying data science from scratch. ... More Photo Sincere media at UnsplashSomeone asked me recently how he can gain the knowledge and skills needed to become a data scientist. There are different ways to study data science, go to university, follow a bachelor's or master's degree in data science, get into the Bootcamp program, or learn it yourself. Currently a lot of stuff is available on the Internet, often for free, to learn the skills needed for Data Science. There are three basic skills required for Data Science 1) the programming language used in the data ecosystem, usually one from Python/R or Scala 2) S'L, for data processing and extraction, and 3) statistics and machine learning. Assuming this is your first programming language, Python is a great language to learn. It's a general-purpose programming language with a broad data library ecosystem. It is also relatively straight forward to learn and is often taught in entrance classes for computer science. It's good to start with a general introduction to your computer not more data focus Python of course. The introduction of edX into computer science and programming using Python provides a decent entry point for getting used to programming principles. Although there are some problem sets to complete, it will be necessary to consolidate the knowledge gained during practical exercises or with the project. Hackerrank provides a practical learning path, which I find an excellent continuation of the introductory course - doing some of the simple Python exercises should introduce you to using the language. One of the best ways to learn a programming language is first to learn some of its concepts and then some projects to consolidate knowledge. Simple designs on their own, provides an opportunity to see how everything fits together. At this stage, there is no need to go beyond standard Python libraries. When you feel comfortable applying Python in your projects, it should be a good time to deepen your understanding of Python. Some good themes for deep immersion are iterators and generators. Decorators, Argument unboxing, Context manager is always a useful idea for deep immersion in the library links of some Python. Topics around datatypes, file and access directory, general operating system services are good chapters to get into, as well as the odd marinade topics. csv, json and unit tests themes. With this acquired knowledge, it should be able to work on some personal projects of manipulation and file processing exclusively in Python. Creating a project using CLI (arg parse) is a great way to make it useful and interesting. An example of a project is a file organizer project that reorganizes into a subfolder based on file type and content. It would be less effective than specialized libraries, but it would help to consolidate that knowledge. If you have some idea of building file processing applications, the logical next step is to gain some knowledge about the more specific pandas and Numpy data libraries. DataCamp and Dataquest are among the providers that offer interactive tutorials for these libraries. Understanding how to use these libraries is usually a prerequisite for studying libraries focused on statistical and machine learning. The next step is to recognize some of the other important libraries used in Python, such as queries, scraper, sqlalchemy or django. This will give you the knowledge to really make full-blown applications that either get or superficial data. After that, it will be a continuous learning path, and the best way to continue to improve is to work on projects that will allow you to work out your code. Open source projects are usually well prepared for this. S'LS is an important skill to learn for each scientist. They use it to convert and extract data from databases. This is one of the most frequently asked questions in the science data interview. Of the different types of S'L out there, the most important thing for these scientists is the mastery of the basic analytical S'L. There's a few internet resources that help get some information in S'L. W3School gives an excellent first review, while the Code Academy, Hackerran and Khan Academy provides a hands-on approach to S'L training. THE SDS is better learned through a practical approach, and there's nothing better for that than playing and trying to make sense of different data sets. The S'Lite database provides a decent way to gain some experience with small datasets with relatively low efforts. The main difficulty with S'L practice is finding datasets in practice. Statistics and machine learning! If you haven't had many statistical courses during previous studies, it's helpful to take an introductory course of statistics and machine learning covering the following topic of regression (linear/logistics), tree-making, random forest, k-tools and KNN. EDX offers a good in Analytics Edge. One of the drawbacks of the course is. However, because it uses R for a programming language, this means that it will be necessary to study Python statistical libraries, such as sklearn, separately. Subsequent training with a more in-depth theoretical course, such as Introduction to Statistical Learning, is centered around the free download of a book of the same name (also available a printed copy). The course manages deeper into the concept, not too deep into the math of it. It is worth getting a good base of algorithms, encoding them from scratch. Many science data interviews you on knowing some of the basic algorithms to see if you understand them. Coding them from scratch allows you to know them inside out. On a more practical note, Kaggle provides some decent projects to get used to the part of the workflows of data science. They provide datasets and see how other people approach the same issues. It's worth trying out some of the challenges, at least to get more familiar with the various machine learning libraries and pre-processing steps. Kaggle competitions tend to be very focused on the approach to modeling rather than on data conversion and usually use very clean data sets, which is very far from the working reality of scientific data. Once you've done a few Kaggle, the most rewarding is to get some hands-on experience on real (read impure) data sets. Get datasets to clean up, debug, and fix problems that occur when learning on such datasets. To do this, either source your own data, scrape information from websites, or get some project experience on websites such as freelancer.com. Depending on what you would like to specialize in, there are several online resources that will be introduced in specific areas. Coursera machine learning with Andrew Ng's Python provides, for example, an excellent introduction to deep learning, as well as other machine learning concepts. There are other topics from and machine learning, which are useful data of scientists to learn, such as NLP, NLP, Vision, or Bayesian Stats. Summary There has quite a few resources to help yourself learn different aspects of data science. It is very important to get a good enough coding experience, both through the theoretical basis and through work on projects. Couple this with a good understanding of the basic models of machine learning, some Kaggle exercises, and some work on real data sets, and you should have the right basis for learning the journey, however, do not stop there. Data Science is a continuous learning discipline in which you can learn from many a graduating areas. There are topics that data scientists can get into, such as programming and using Spark, delving into the TensorFlow code, rather than relying only on Keras, programming for GPU using CUDA, working with Graph technology... In addition, you can grow by getting broader statistics/ml, specializing in specific domain areas, reading and implementing scientific papers, improving your engineering skills, or getting more into product management.
